

Quick & Dirty?  
Mobility of PFAS in Ground and Surface Water:  
A Four Site Case Study

*International Clean-Up Conference  
Adelaide September 8-12*

Christopher Sandiford, Senversa  
Dr Brad Clarke, University of Melbourne

# Introduction

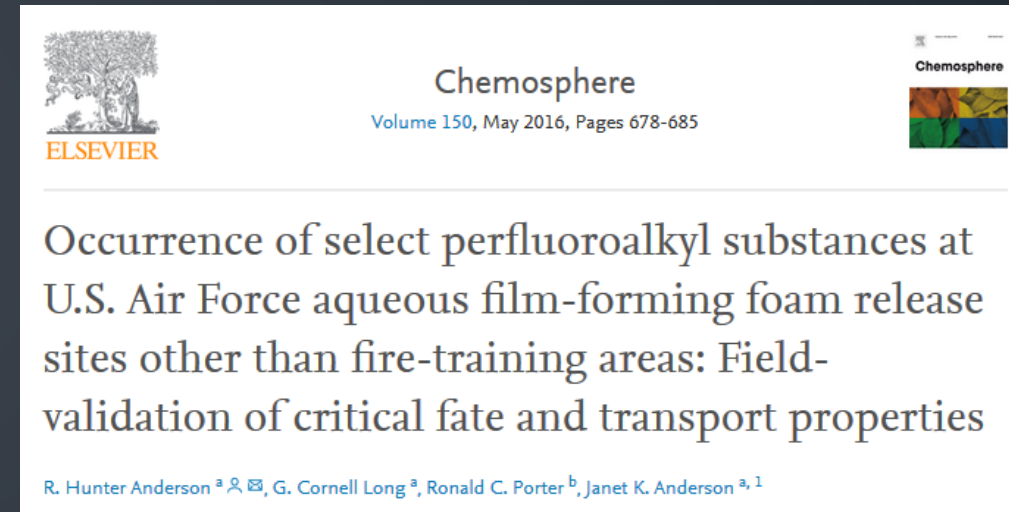

- A. Why should I care about differential PFAS retardation?
- B. Status of Investigation of PFAS retardation
- C. Factors Influencing Retardation
- D. PFAS of Interest
- E. PFAS Data Review from 4 Investigation Sites
- F. Key Findings

# Why differential PFAS Retardation is Important

- Sensitive receptors normally not present PFAS source zone.
- Sensitive receptors commonly impacted down-gradient at either:
  - A. Surface Water Discharge Point
  - B. Groundwater Discharge Point
- The retardation of PFOS, PFOA, PFHxS & other PFAS can be multiple orders of magnitude different, particularly in groundwater...
- Remediation clean-up targets for soil @ source zone already consider leachability of PFAS *but they may now also need to consider* differential retardation of PFAS in surface and groundwater.
- i.e We may be worrying about the wrong PFAS!.. 

# PFAS – They don't migrate the same

- Recent-ish studies have found very few of the PFAS compounds present in groundwater were significant contributors to the AFFF formation (Anderson et al., 2016)
- PFCAs and FTSs are largely absent from AFFF formulations but are among the most prevalent PFAS in groundwater.
- Variable retardation of PFAS is most likely a combination of interfacial adsorption + organic carbon sorption + transformation of pre-cursors.
- Other factors likely to contribute are pH, ionic composition of aquifer, formulation of AFFF, co-contaminants present, remedial actions attempted & the degradation environment.

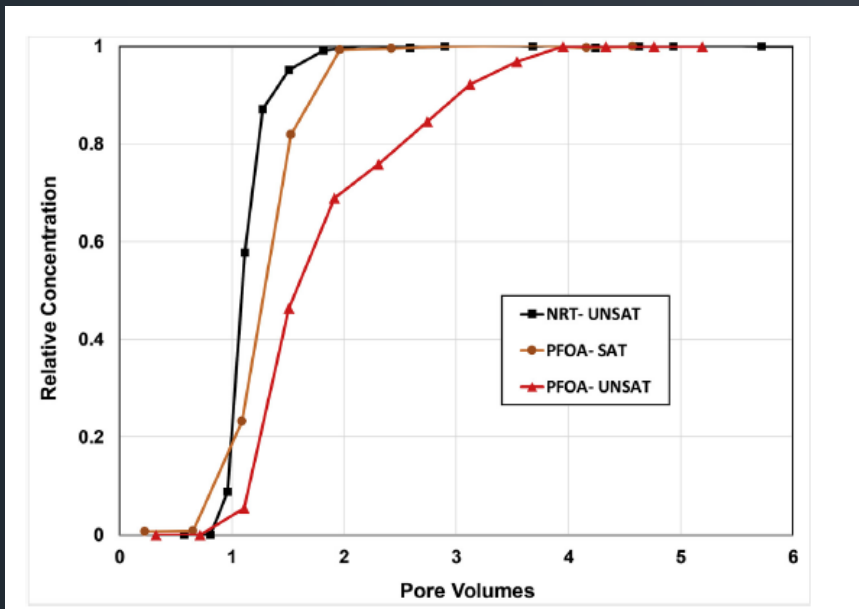

# Modelling of Retardation

Attempts to model PFAS transport in source zones are now being undertaken (Brusseau et al., 2019).

- PFOS retardation factor in soil: 7.3 unsaturated V 3.6 saturated
- Air-water interfacial adsorption found to contribute **80% of retention in sand and 32% in soil.**

Comprehensive retention model for PFAS transport in subsurface systems

Mark L. Brusseau <sup>a,b,\*</sup>, Ni Yan <sup>b</sup>, Sarah Van Glubt <sup>a</sup>, Yake Wang <sup>a</sup>, Wei Chen <sup>a</sup>, Ying Lyu <sup>a,c</sup>, Barry Dungan <sup>d</sup>, Kenneth C. Carroll <sup>d</sup>, F. Omar Holguin <sup>d</sup>

- Modelling will improve ability to predict PFAS concentrations at points of discharge in the future.
- However, site specific data of multiple soil horizons / aquifers means precision will remain poor until large databases are made available.

# Overview of Four Australian PFAS Contaminated Sites

Soil, groundwater and surface water collated from four Australia sites:

- **Site 1 - Airport**
- **Site 2 - Defence**
- **Site 3 - Energy Sector**
- **Site 4 - Fire Training**

- PFAS impact linked to historical fire training at all sites.
- All unconfined / semi confined aquifers ranging from 1 m to 60 m deep beneath source zones.
- Surface water samples obtained from Creeks / unlined drains between 10m – 4km from PFAS source zone.

# Key PFAS of Interest

Abbrievated Name	Carbon Chain Length	log K <sub>oc</sub> (ml. g <sup>-1</sup> )	OECD Chain Length
PFOS	8 Carbons	4.2 - 4.5	Long-chain PFSA
PFOA	8 Carbons	1.89 - 3.5	Long-chain PFCA
PFHxS	6 Carbons	2.05 - 3.7	Long-chain PFSA
PFHxA	6 Carbons	1.31 - 2.1	Short-chain PFCA
PFPeS	5 Carbons	-	Short-chain PFSA
PFPeA	5 Carbons	1.37	Short-chain PFCA
PFBS	4 Carbons	1.22 - 1.79	Short-chain PFSA

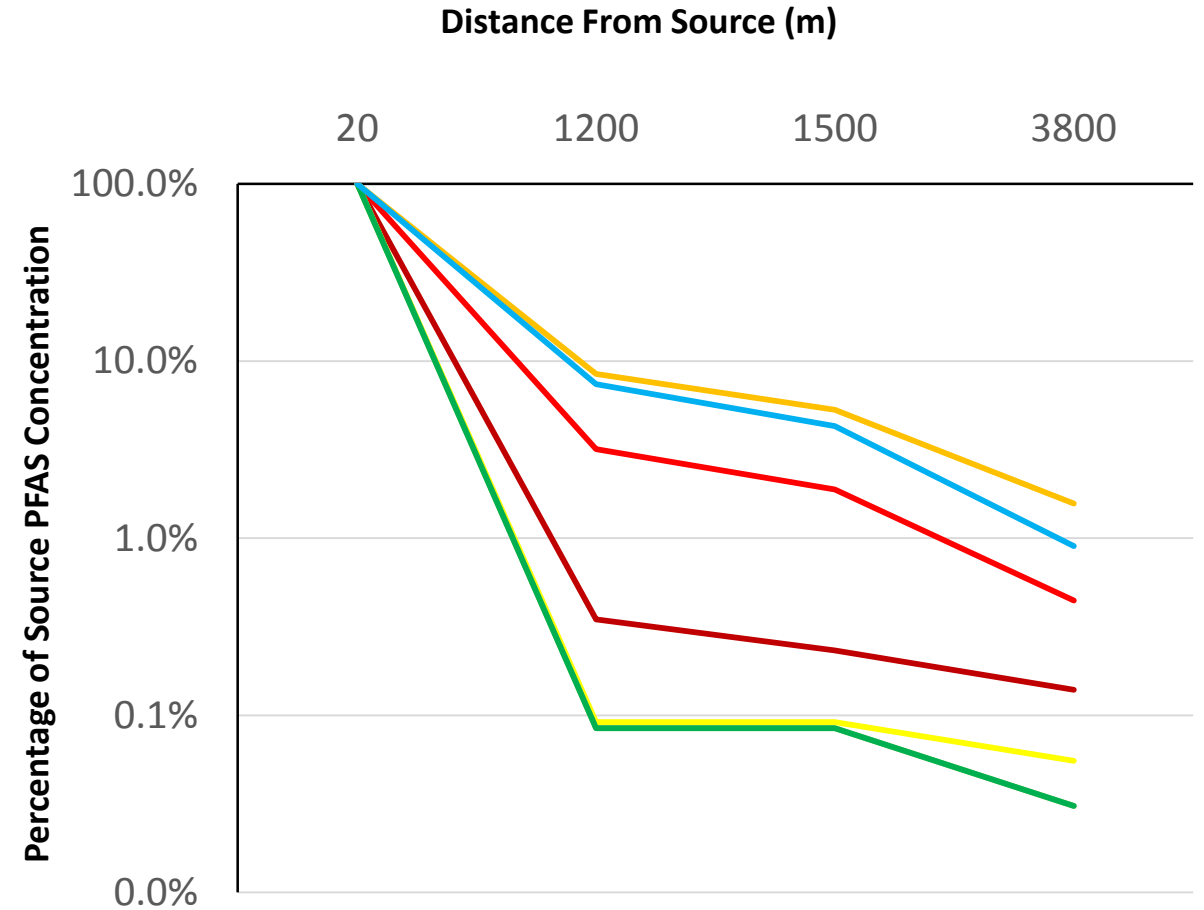

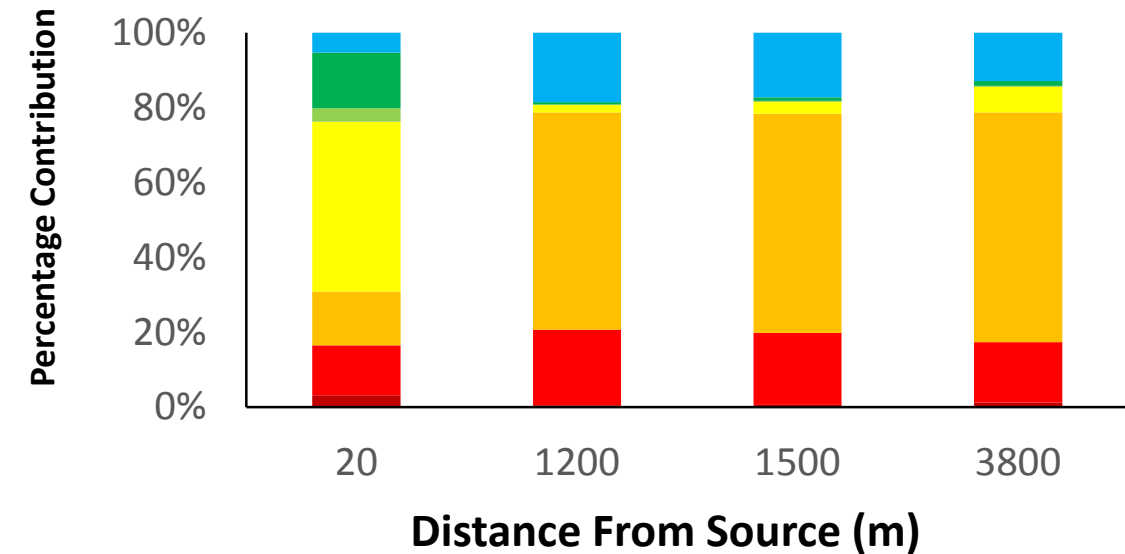

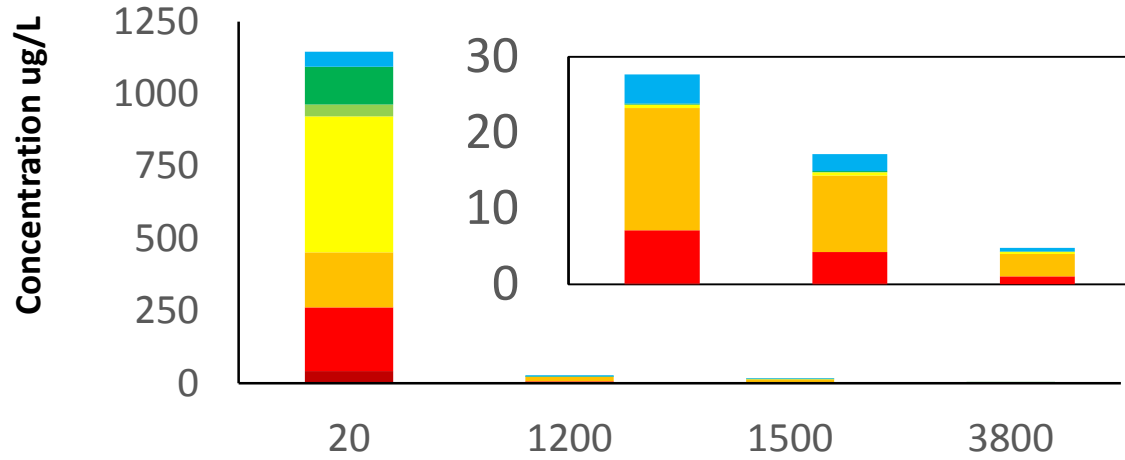

- Consistently present as main PFAS in groundwater at all sites.
- PFHpA, PFHpS and 6:2 FTS also present in groundwater on most sites, but not all.

Short-chain PFCAs				Long-chain PFCAs				
PFBA	PFPeA	PFHxA	PFHpA	PFOA	PFNA	PFDA	PFUnA	PFDoA
PFBS	PFPeS	PFHxS	PFHpS	PFOS	PFNS	PFDS	PFUnS	PFDoS
Short-chain PFSA				Long-chain PFSA				

# Site 1 Airport: Surface Water

■ PFOA 
 ■ PFOS 
 ■ PFHxS 
 ■ PFHxA 
 ■ PFPeS 
 ■ PFPeA 
 ■ PFBS

# Site 1 Airport: Groundwater

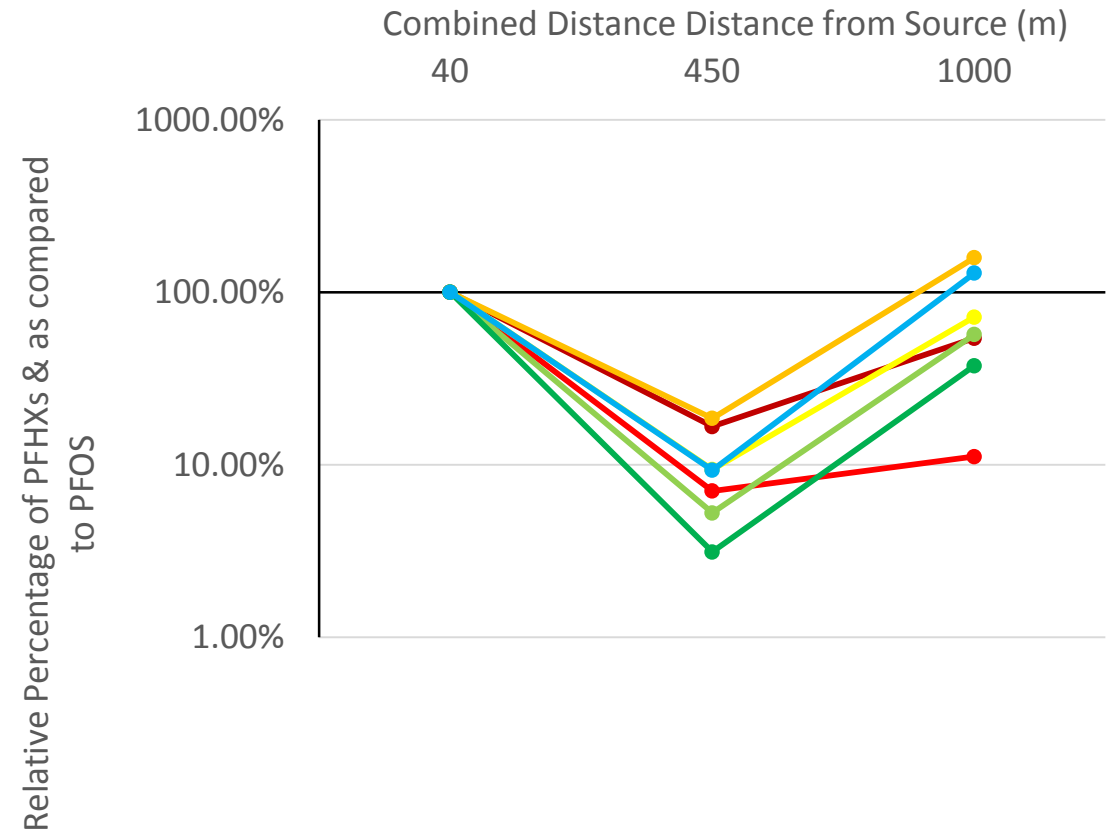

■ PFOA  
 ■ PFOS  
 ■ PFHxS  
 ■ PFHxA  
 ■ PFPeS  
 ■ PFPeA  
 ■ PFBS

# Site 2 Defence: Surface Water

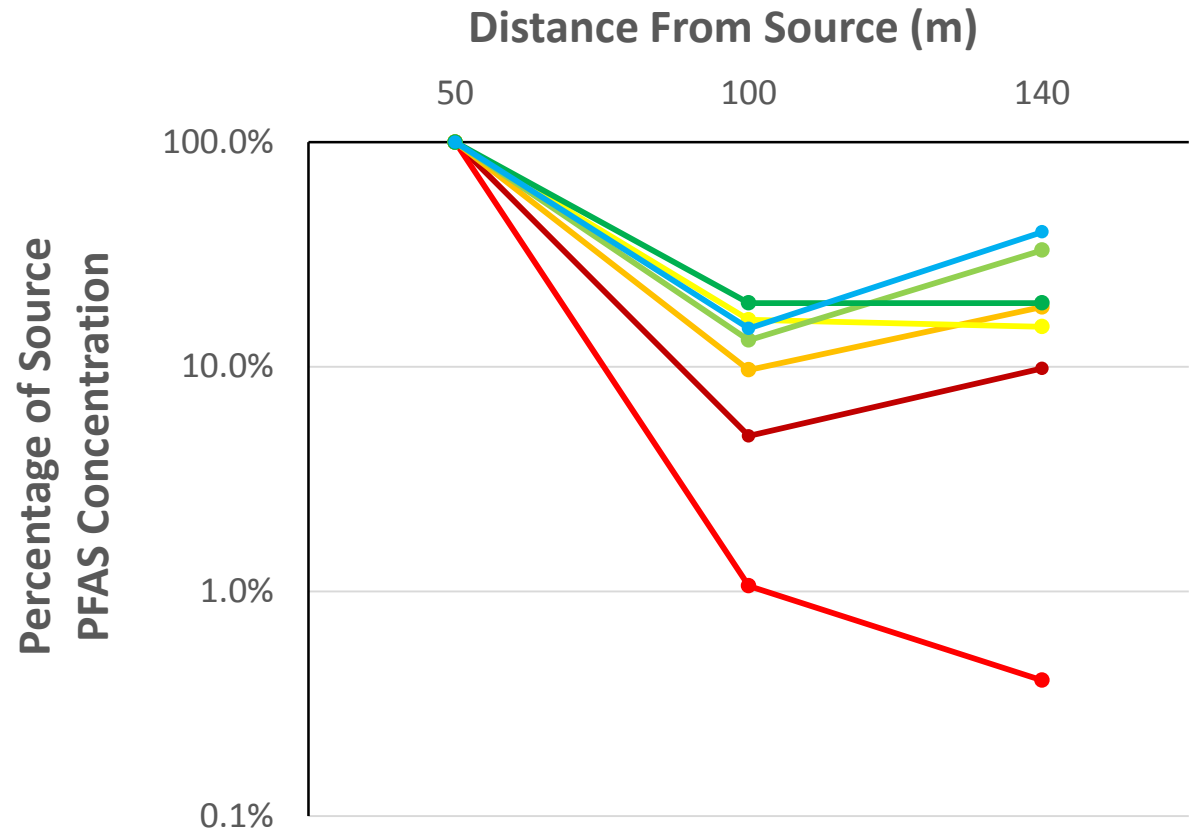

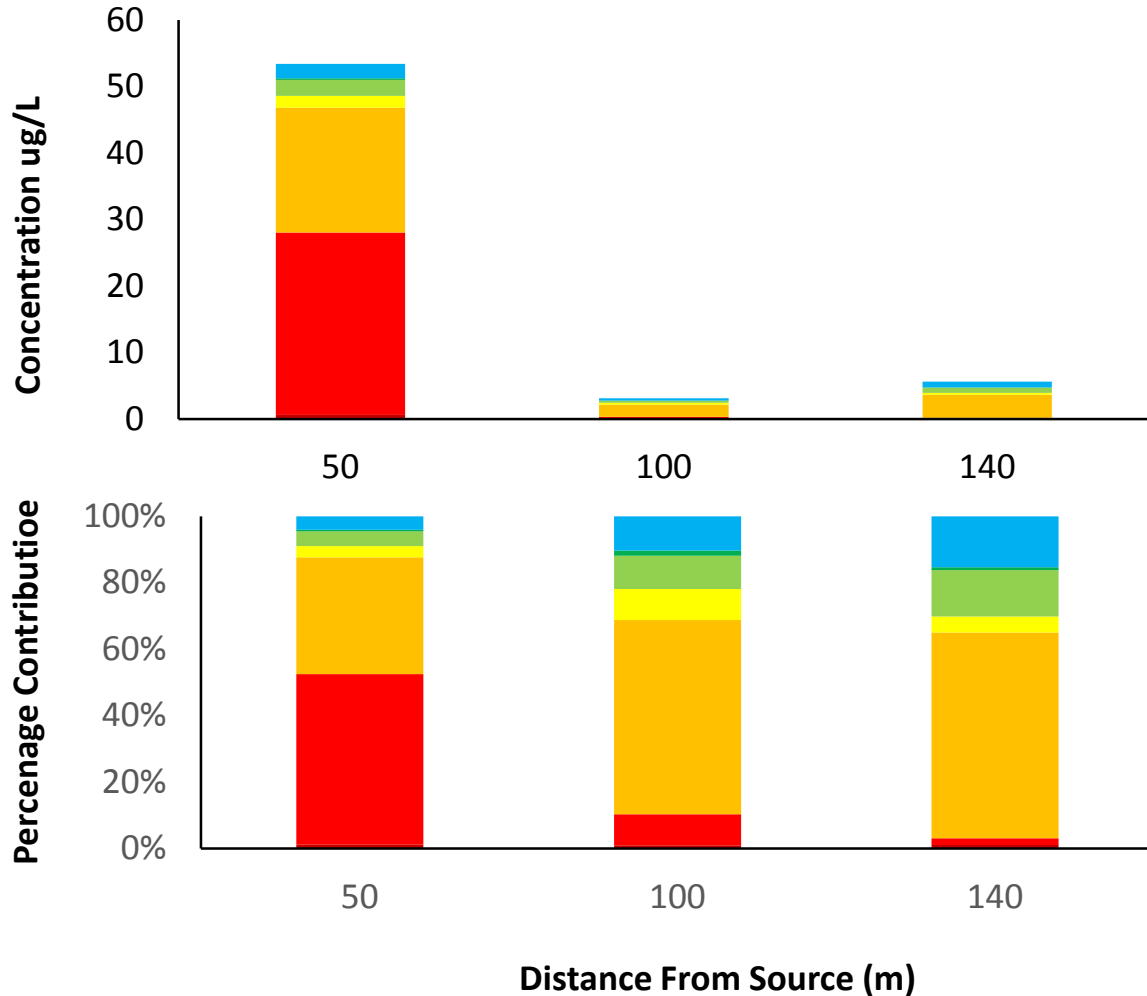

■ PFOA 
 ■ PFOS 
 ■ PFHxS 
 ■ PFHxA 
 ■ PFPeS 
 ■ PFPeA 
 ■ PFBS

# Site 2 Defence: Groundwater

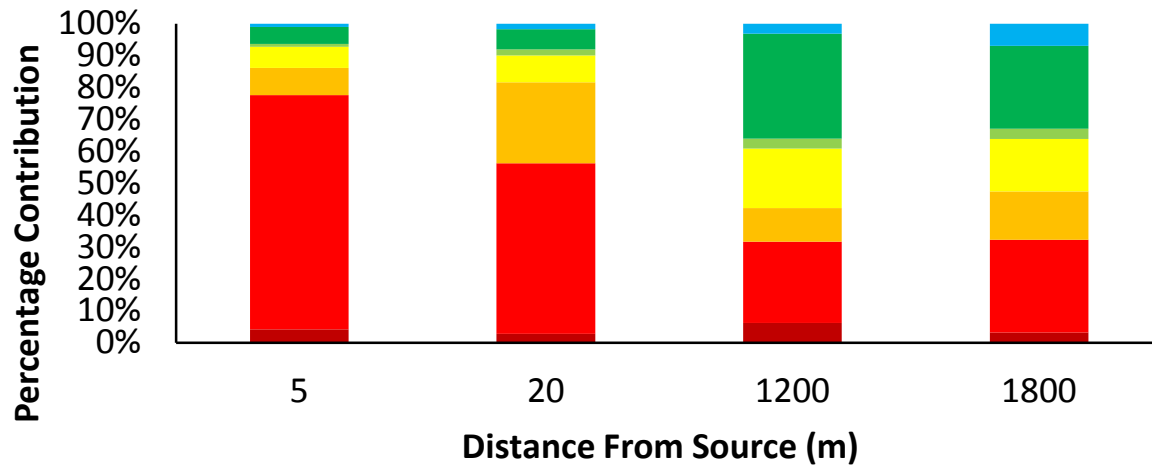

■ PFOA 
 ■ PFOS 
 ■ PFHxS 
 ■ PFHxA 
 ■ PFPeS 
 ■ PFPeA 
 ■ PFBS

# Site 3 Energy: Surface water

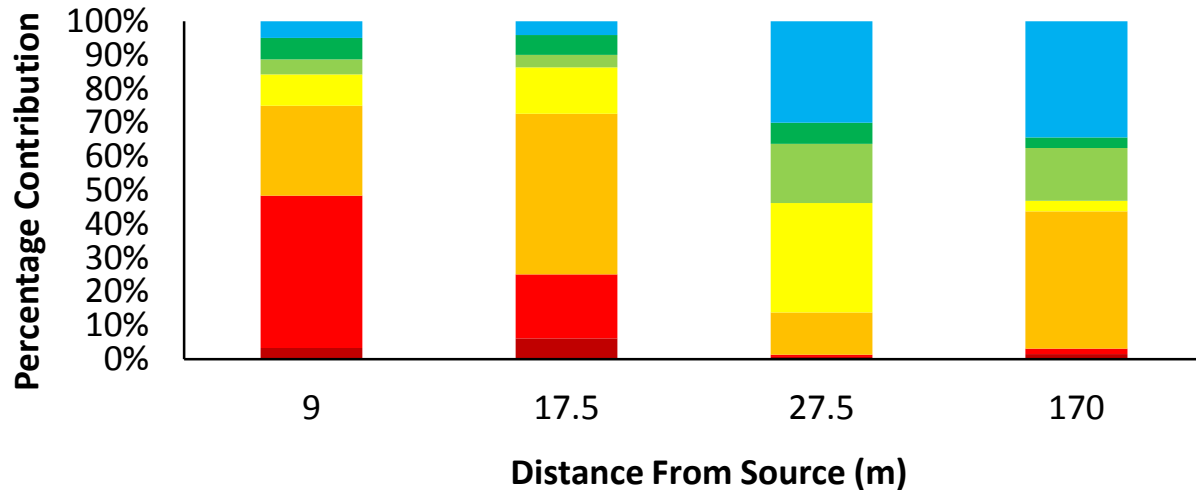

■ PFOA 
 ■ PFOS 
 ■ PFHxS 
 ■ PFHxA 
 ■ PFPeS 
 ■ PFPeA 
 ■ PFBS

# Site 3 Energy Sector: Groundwater

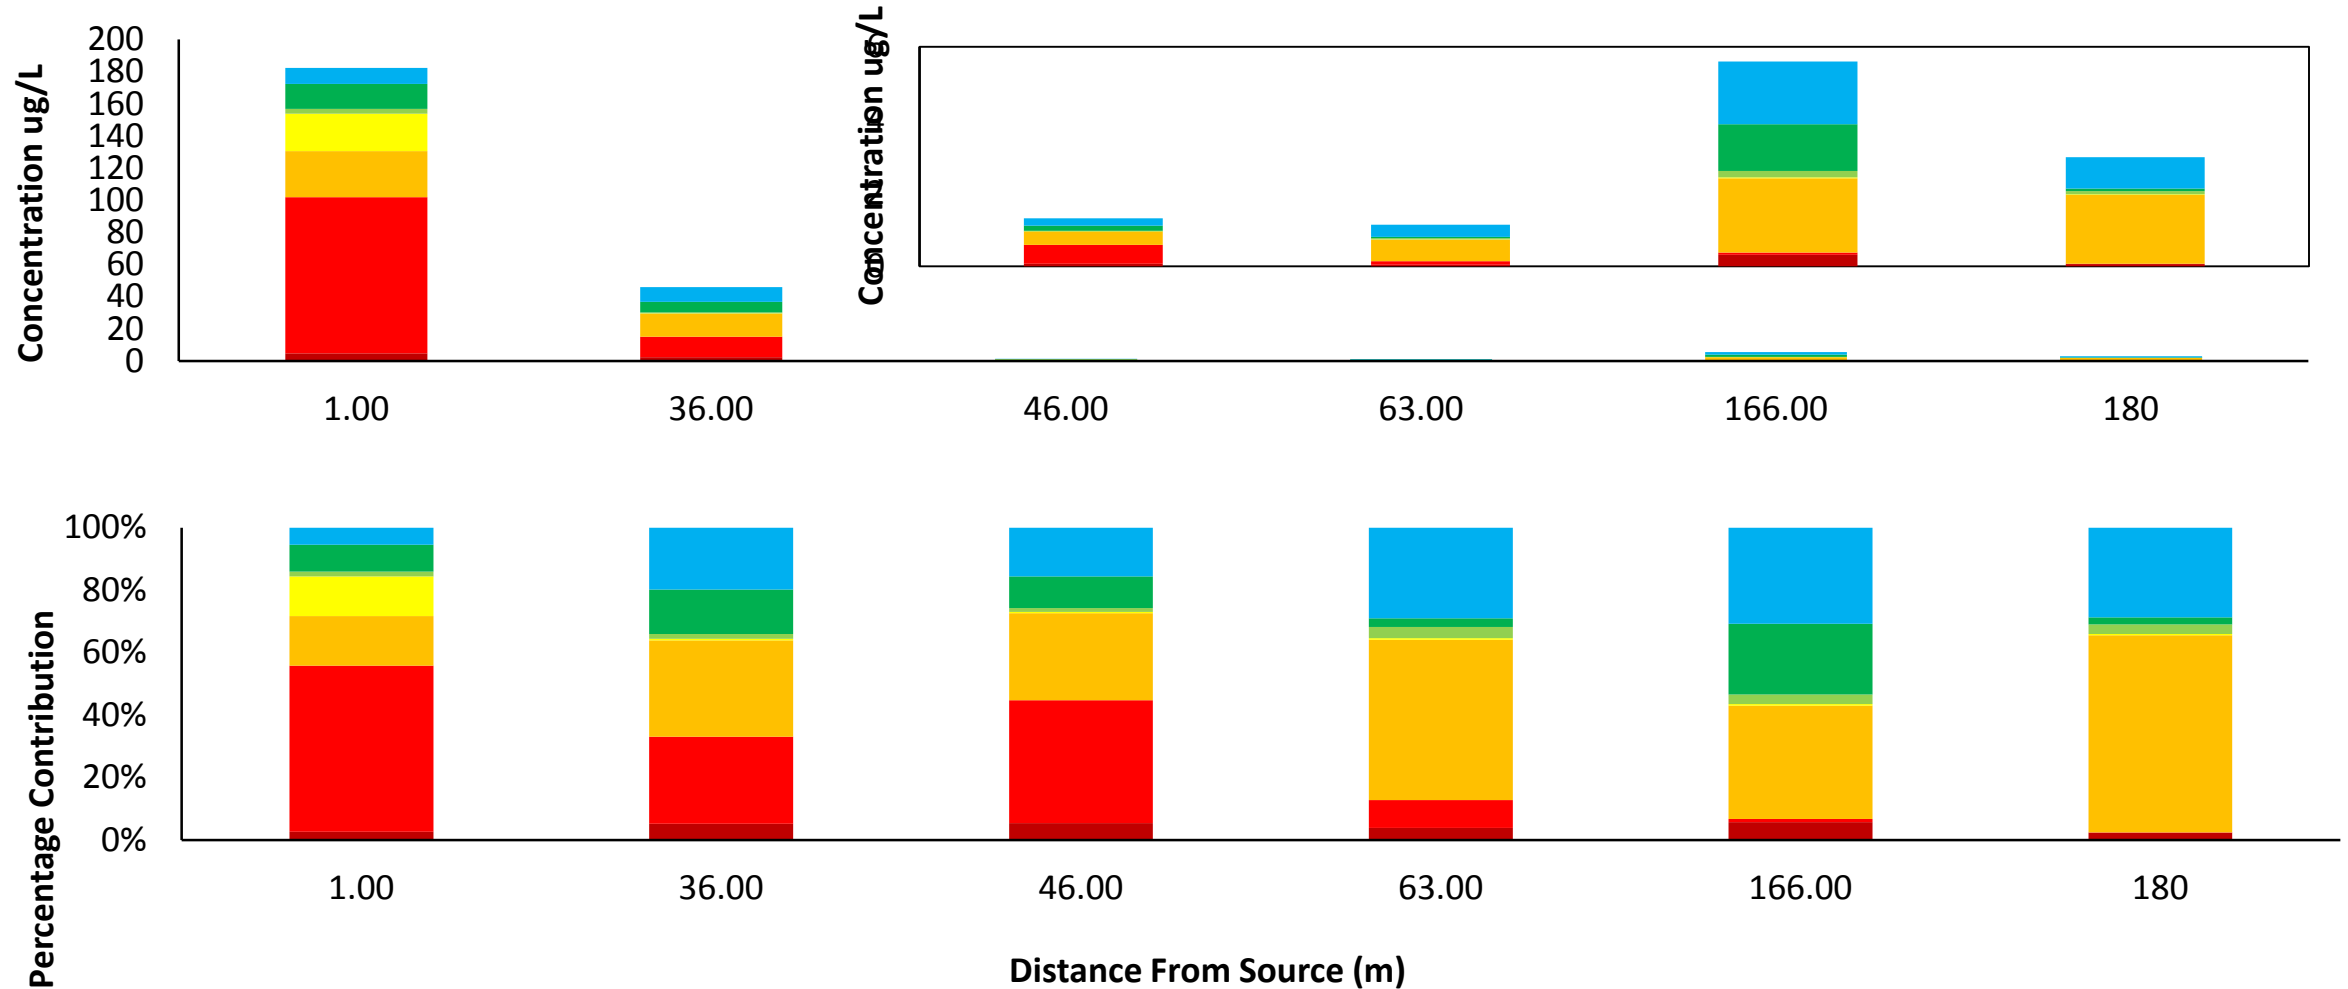

■ PFOA 
 ■ PFOS 
 ■ PFHxS 
 ■ PFHxA 
 ■ PFPeS 
 ■ PFPeA 
 ■ PFBS

# Site 4 Fire Training: Groundwater

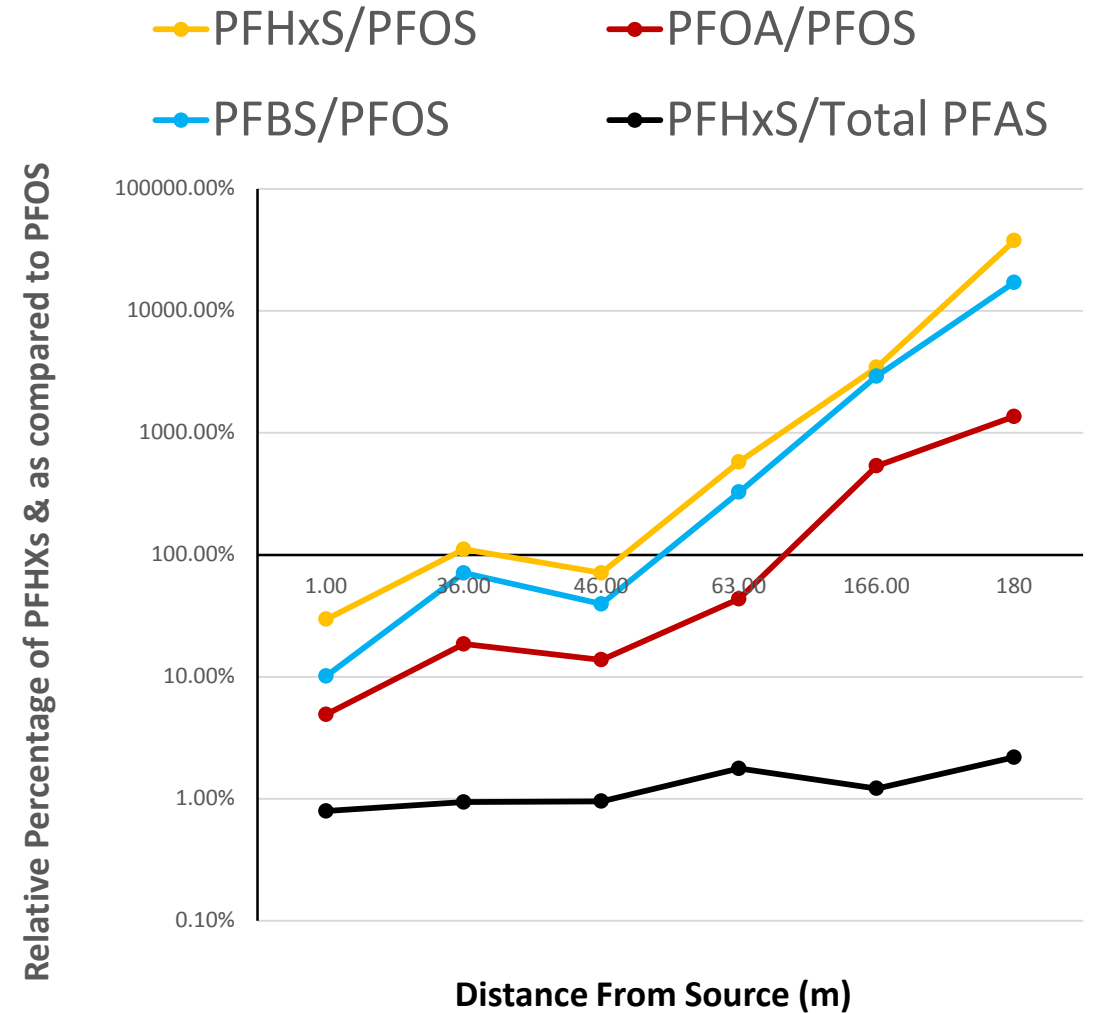

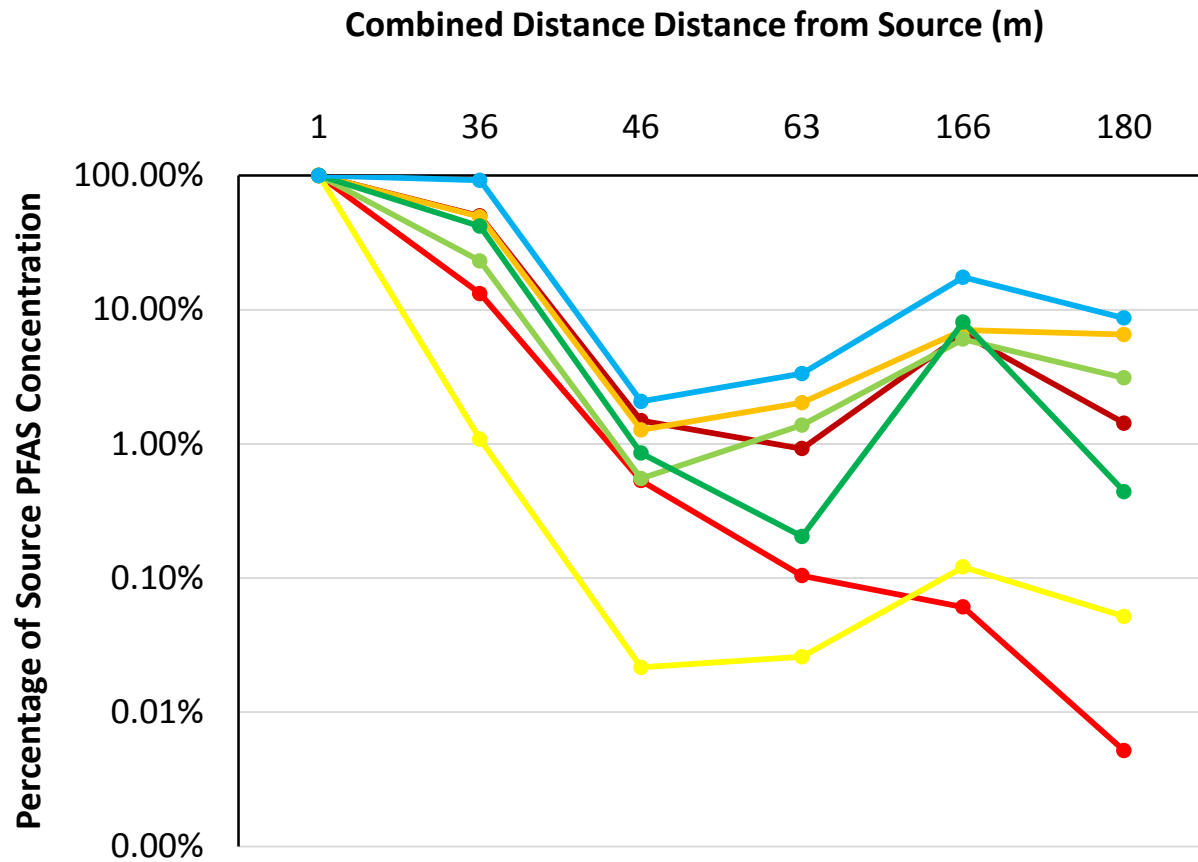

■ PFOA 
 ■ PFOS 
 ■ PFHxS 
 ■ PFHxA 
 ■ PFPeS 
 ■ PFPeA 
 ■ PFBS

# Site 4 Fire Training: Groundwater

- PFOA
- PFOS
- PFHxS
- PFHxA
- PFPeS
- PFPeA
- PFBS

# PFAS Retardation Findings

- PFHxS was retarded significantly less than PFOS in surface water and groundwater at all four sites.
  - Between 50 and 80,000 times less retardation in groundwater.
  - Between 2 and 100 times less retardation in surface water.
- PFOA was consistently less retarded than PFOS in both surface and groundwater.
- PFHxA was unexpectedly present at lower concentrations on 2 of 4 sites.
- Retardation in groundwater was consistent with chain length in 2 of 4 sites.
- Less consistent and lower rates of retardation of PFAS in surface water.

# Key Points

- A. Consistent evidence of differential retardation of PFAS compounds in groundwater and surface water. In particular increased concentrations of PFHxS relative to PFOS.
- B. Further work required to understand / quantify factors impacting migration.
- C. Higher concentrations of PFOS as compared to PFHxS may be able to remain in source areas due to higher retardation of PFOS and lower likelihood of impacting sensitive receptors.
